

كلية الهندسة والعلوم التطبيقية

برنامج الهندسة المعمارية والتصميم العمراني

اللائحة الداخلية

لمرحلة البكالوريوس

٢٠١٨

بيانات أساسية للبرنامج:

- اسم البرنامج : الهندسة المعمارية والتصميم العمراني
- الكلية / المعهد : كلية الهندسة والعلوم التطبيقية
- الجامعة : جامعة النيل
- عدد ساعات الاتصال : ٣٧٥٠ ساعة (٢٥٠ أسبوعيا) مقسمة إلى:
 - ١٣٨٧,٥ ساعة محاضرات (٩٢,٥ أسبوعيا)
 - ٢٣٦٢,٥ ساعة تمارين ومعمل (١٥٧,٥ أسبوعيا)
- عدد الساعات المعتمدة : ١٦٠ ساعة
- عدد المقررات : ٥٣ مقرر شاملة ٢ مقرر (لغة إنجليزية مكثفة بدون ساعات) + ٢ مقرر مشروع تخرج + ١ مقرر تدريب عملي
- منسق البرنامج : أ.د./ دينا كمال الدين شهاب
- تاريخ بدء البرنامج :

مادة (١) : رسالة البرنامج

إن رسالة برنامج بكالوريوس الهندسة المعمارية والتصميم العمراني بكلية الهندسة والعلوم التطبيقية بجامعة النيل هي إعداد خريجين من مهندسين معماريين قادرين على إحداث نقلة نوعية في ممارسة مختلف مجالات وتطبيقات الهندسة المعمارية والتصميم العمراني مع اهتمام خاص بالبعد الإنساني والتفاعل المتبادل بين الناس والبيئة المعمارية والعمرانية، فضلا عن تأهيل الخريجين لتوظيف التقنيات الحديثة وتكنولوجيا الاتصالات والمعلومات في البحث والتصميم وحل المشكلات وتمكينهم من استكمال الدراسة في برامج الدراسات العليا بالجامعات المصرية والعالمية ، وذلك من خلال توافر بيئة تعليم وتعلم داعمة لتحقيق التميز، ومؤهلة لاكتساب المهارات العلمية والعملية في التخصص ودعم القيم الأخلاقية للمهنة بالإضافة إلى توفير فرص التعليم الذاتي المستمر .

وتتمثل الرؤية في تطوير برنامج أكاديمي متميز وذلك من خلال التكامل بين التكنولوجيا والثقافة، والتوفيق بين الفنون والعلوم الاجتماعية والهندسة، باستخدام أحدث التقنيات لمواجهة التحديات التي تواجه بناء التجمعات البشرية التي تدعم وتحافظ على تحقيق القيم الإنسانية وترفع من مستوى المعيشة وتحقق الازدهار .

مادة (٢) : توصيف البرنامج الدراسي

أعد برنامج الهندسة المعمارية والتصميم العمراني بكلية الهندسة والعلوم التطبيقية بجامعة النيل اللائحة الداخلية لبرنامج جديد في مجال العمارة والتصميم العمراني يتميز بالتكامل والتعدد في التخصصات التي يكون فيها الإنسان ودراسة الأبعاد الاجتماعية والسلوكية له إضافة للقاعدة العلمية ومحور الدراسة والتطبيق بها لما لها من تأثير متبادل مع البيئة المعمارية والعمرانية ، فضلا عن استخدام تكنولوجيا الاتصالات والمعلومات كأداة هامة وداعمة للطالب لتمكينه من التطبيقات المختلفة لتصميم العمارة والعمران الملائم والمستدام.

البرنامج يؤهل للحصول على درجة بكالوريوس في مجال الهندسة المعمارية والتصميم العمراني وهو يعتمد على نظام الساعات المعتمدة في الدراسة، وحيث أن مجالات الهندسة تتسع إلى العديد من الموضوعات فقد تم تصميم عدد من المقررات الاختيارية لتغطي القضايا الملحة المتصلة بالمجال.

مادة (٣) : أهداف البرنامج

يهدف البرنامج الدراسي في برنامج الهندسة المعمارية والتصميم العمراني بكلية العلوم الهندسية بجامعة النيل إلى إعداد كوادر من المهندسين المعماريين القادرين على إحداث نقلة معرفية وإبداعية في ممارسة مهنة العمارة والتصميم العمراني في مصر بجعل العنصر البشري هو محور اهتمامها مما يجعلها محققة للاستدامة البيئية والاقتصادية والاجتماعية.

ويتم ذلك عن طريق إكساب الطلاب المهارات الأكاديمية والتقنية وتوفير علاقات قوية بين القطاعات المشاركة في عملية إنتاج وإعادة تأهيل المجتمعات العمرانية المحلية والعالمية مع خريجي البرنامج في المجالات المتعلقة بالبحث والتدريب العملي والأعمال لتصميم وتنفيذ مشروعات معمارية وعمرانية أكثر شمولية ومراعاة للبعد الإنساني مع استغلال التقنيات الحديثة.

بالإضافة لتدريب الطلاب على ممارسة المنهجية في التفكير وتوصيف المشكلات والمتطلبات التصميمية بأساليب علمية تضمن تلبية احتياجات الأجيال الحالية والمستقبلية من النواحي الاجتماعية والسيكولوجية والثقافية كمدخل لتحقيق التنمية العمرانية المستدامة وتحسين مستوى المعيشة بما يشمل من تحقيق السلامة وأمن المجتمع والتمكين للاستدامة البيئية والاقتصادية من خلال التخطيط السليم والعمل التشاركي.

ويتم تحقيق هذه الأهداف من قبل أعضاء هيئة التدريس في الهندسة المعمارية والتصميم العمراني ذوي الخبرة في إدارة الأنشطة الهندسية والتقنية.

مادة (٤) : مخرجات البرنامج ومواصفات الخريج

لتحقيق أهداف البرنامج يجب أن يكون الخريج :

١- مجهزاً علمياً وتقنياً لممارسة مهنة الهندسة المعمارية والتصميم العمراني لخلق تصميمات هندسية معمارية وعمرانية تلبي متطلبات المستخدمين بفئاتهم المختلفة بالإضافة إلى المتطلبات الجمالية والتقنية من خلال اكتسابه العلوم والمهارات التقنية في مجالات الثقافة المحلية والتراث والعلوم الإنسانية والتقنيات الحديثة في البناء والعمران.

- ٢- قادراً على التعامل مع البيئة العمرانية (المبنية والفراغات العامة)؛ سواء بتحسينها وتطويرها من خلال إعادة تأهيل العمران القائم أو بتصميم وإنشاء عمران جديد.
- ٣- قادراً على التعرف على المشاكل الهندسية المعمارية والعمرانية وكيفية تحليلها للوصول إلى موجهات حلول وتصميمات تحقق الاحتياجات المحلية للمجتمع وبما يتلاءم مع البيئة الاجتماعية والاقتصادية والمناخية المحيطة.
- ٤- مجهزاً للعمل في مجالات متعددة في العمارة والعمران من خلال اكتسابه العلوم والمهارات التقنية لإعداد وتنفيذ تصميمات معمارية وعمرانية تحقق الاستدامة البيئية والاقتصادية والاجتماعية باستخدام البرامج والتقنيات الهندسية الحديثة وأحدث ما توفره تكنولوجيا المعلومات والاتصالات في مجالات البحث والتصميم والتنفيذ.
- ٥- ملماً بالمناهج العلمية لإدارة المشروعات المعمارية والعمرانية وهندسة القيمة وقادراً على إعداد مخططات ملبية للكودات المصرية وإصدار الشهادات المطلوبة للمشروعات.
- ٦- قادراً على العمل بكفاءة وتكامل في فريق متعدد التخصصات سواء في نفس تخصصه أو في تخصصات هندسية مساندة أو في تخصصات غير هندسية (اجتماعية - اقتصادية -) مكملة لتقديم الخدمات المهنية والنتاج المعماري والعمراني الكفاء.
- ٧- قادراً على التواصل شفهيّاً وكتابياً بمهنية مع المشاركين في العمل ومتمكناً من إجراء المقابلات والاستبيانات الشفهية وتحليلها ولديه مهارات الإشراف على مجموعة من الفنيين والقيام بإشراك الأطراف المعنية والمستفيدين في عملية وضع متطلبات التصميم وموجهات الحلول والتصميم.
- ٨- متقهماً لدور المهندس المعماري في إنتاج البيئة العمرانية الملائمة وقادراً على المشاركة في إعداد مستندات طرح العطاءات الهندسية والاشتراك في وضع البرامج المكملة فيما يخص إدارة العمران لتحقيق النتائج المستهدفة.
- ٩- مقدراً للتعليم والتطور المستمر واكتساب المهارات الجديدة والمستحدثة والإلمام بالمستجدات في مجال العمارة والعمران على الساحتين المحلية والعالمية.

وسيكون الخريج من هذا التخصص مؤهلاً للعمل في:

- ١- المشروعات المعمارية.
- ٢- مشروعات التخطيط العمراني والتصميم الحضري.
- ٣- مشروعات التطوير وإعادة التأهيل.
- ٤- أعمال الهندسة البيئية.
- ٥- أعمال تنسيق المواقع.

مادة (٥) : المعايير الأكاديمية للبرنامج

يلتزم البرنامج بالمعايير الأكاديمية المقترحة من قبل الهيئة القومية لضمان جودة التعليم والاعتماد كحد أدنى، والمعايير الأكاديمية لبرنامج الهندسة المعمارية والتصميم العمراني المقترح يحدد المستوى والإمكانات والقدرات المتوقعة للخريج كآلاتي:

A. Competencies for Engineering Graduates

The Engineering Graduate must be able to:

- A.1. Identify, formulate, and solve complex engineering problems by applying engineering fundamentals, basic science and mathematics
- A.2. Develop and conduct appropriate experimentation and/or simulation, analyze and interpret data, assess and evaluate findings, and use statistical analyses and objective engineering judgment to draw conclusions.
- A.3. Apply engineering design processes to produce cost-effective solutions that meet specified needs with consideration for global, cultural, social, economic, environmental, ethical and other aspects as appropriate to the discipline and within the principles and contexts of sustainable design and development.
- A.4. Utilize contemporary technologies, codes of practice and standards, quality guidelines, health and safety requirements, environmental issues and risk management principles.
- A.5. Practice research techniques and methods of investigation as an inherent part of learning.
- A.6. Plan, supervise and monitor implementation of engineering projects.
- A.7. Function efficiently as an individual and as a member of multi-disciplinary and multi-cultural teams.
- A.8. Communicate effectively – graphically, verbally and in writing – with a range of audiences using contemporary tools.
- A.9. Use creative, innovative and flexible thinking and acquire entrepreneurial and leadership skills to anticipate and respond to new situations.
- A.10. Acquire and apply new knowledge; and practice self, lifelong and other learning strategies.

B. Competencies for ARCHITECTURE Engineering Graduates

In addition to the above Competencies for All Engineering Programs the BASIC ARCHITECTURE Engineering graduate must be able to:

- 1.. Create architectural, urban and planning designs that satisfy both aesthetic and technical requirements, using adequate knowledge of: history and theory, related fine arts, local culture and heritage, technologies and human sciences.
- 2.. Produce designs that meet building users' requirements through understanding the relationship between people and buildings, and between buildings and their environment; and the need to relate buildings and the spaces between them to human needs and scale.
- 3.. Generate ecologically responsible, environmental conservation and rehabilitation designs; through understanding of: structural design, construction, technology and engineering problems associated with building designs.
- 4.. Transform design concepts into buildings and integrate plans into overall planning within the constraints of: project financing, project management, cost control and methods of project delivery; while having adequate knowledge of industries, organizations, regulations and procedures involved.
- 5.. Prepare design project briefs and documents, and understand the context of the architect in the construction industry, including the architect's role in the processes of bidding, procurement of architectural services and building production.

مادة (٦) : تفاعل البرنامج مع احتياجات السوق

من الأهداف الرئيسية للبرنامج المقترح هو التفاعل المستمر مع سوق العمل حيث معرفة الاحتياجات والممارسات الإيجابية والسلبية والثغرات التي يجب العمل عليها، فإن مخرجات البرنامج لابد وأن تتوافق مع متطلبات المستخدم وعليه فإن الجامعة ملتزمة بالتواصل مع المجتمع المحلي وسوق العمل للتعرف على الاحتياجات الحقيقية لهم وبالتالي للخريجين من البرنامج وكذلك لتشكيل قنوات مستمرة لتدريب الطلاب. وقد تم تصميم البرنامج ليتوافق مع ما يشهده العصر من ضرورة فهم وتلبية إحتياجات كافة الفئات من المستخدمين لتقاضي ردود الأفعال غير المخططة وغير المنظمة التي تعاني منها البلاد.

هذا مع تنامي تحديات المدينة المعاصرة المتزايدة خاصة في الدول مثل مصر مما يساهم في ضرورة توافق تخصص الخريجين مع احتياجات السوق الفعلية.

١. يجب تخصيص مدة كافية من الوقت وتصميم برنامج لإدارة الأنشطة العملية والتعرف على حقيقة أنساق إنتاج العمران المختلفة والتعرض لمواقف حقيقية في سوق العمل ومعرفة كيفية

٢. التعامل معها. وإدراج التدريب العملي كجزء من الحصول على الدرجة العلمية ليس فقط في مقرر واحد بل كوحدة مكملة في العديد من المقررات.
٣. إشراك أصحاب الخبرة في ممارسة المهنة بسوق العمل؛ كأعضاء في هيئة التدريس بالجامعة.
٤. الإلتحاق بمؤسسات وجمعيات للمعماريين المحترفين متصلة بأنشطة الجامعة.
٥. إدراج الطلبة في نظام الاستوديو المستخدم في سوق العمل (القائم على حل المشكلات والوعي المجتمعي) من خلال تفعيل ثقافة الـ ٢٤ ساعة استوديو مفتوح.
٦. الاشتراك مع جامعات أخرى محليا ودولياً في الأنشطة العلمية لتطوير المهارات الفكرية والتقنية المستخدمة والمطلوبة في سوق العمل.
٧. تبني فكر "التعلم من خلال المشروع" بالشراكة مع سوق العمل في التعامل مع مشروعات وتحديات عمرانية حقيقية.
٨. تشجيع الحملات القياسية (measurement campaigns) لدراسة المظاهر العمرانية والبيئية.
٩. تبادل الطلبة محليا ودوليا للاطلاع على سوق العمل في ظروف مختلفة.

مادة (٧) : التشابه والتمايز عن البرامج المناظرة

يتميز البرنامج بكونه يقدم للدارسين نموذجاً للأسلوب المنهجي في التعليم الجامعي ورؤية شاملة ومتكاملة في مجال الهندسة المعمارية والتصميم العمراني من خلال التركيز على أساليب التصميم والبحث والتطوير المختلفة في مجال عمل المعماري والمصمم العمراني ودعم ذلك بالنظريات العلمية والخبرة الميدانية ونظم وتكنولوجيا المعلومات الحديثة؛ حيث يستفيد البرنامج من الخبرات المتراكمة في البرامج المناظرة على المستوى المحلي والمستوى الدولي لتقديم منهج دراسي متكامل يعتمد على:

- توفير الأساس النظري والعملي المناسب للتخصص بما يواكب ما يتم تدريسه في الجامعات العريقة محلياً وعالمياً وللبرنامج مكونان أساسيان:
- تقديم الأساس النظري المتكامل والذي يشمل قاعدة علمية مكملة عن العلوم الإنسانية يخدم فئة المعماريين بصفة عامة لتكوين الأرضية الثابتة للتقدم في مجالات عمل المعماري في السوق المحلية والعالمية.

- تقديم المادة العلمية والعملية التي ترتفع بمستوى الطلاب إلى مستوى الفعالية في دور المعماري في المدينة المعاصرة مستنداً على دراسة ما يتم تدريسه بالبرامج المتميزة في مصر وخارجها والتي تتسم بالشمولية والتكاملية بين القاعدة النظرية الواسعة والتطبيق في التصميم.
- توفير نظام الساعات المعتمدة والذي يتيح للطلبة الاختيار من مجموعة من المقررات.
- توفير معامل متكاملة للتطبيقات العملية المصاحبة للدراسة النظرية ومنها معمل Virtual Reality.
- توفير خطة تدريب عملي داخل وخارج الجامعة لتتماشى مع متطلبات المقررات الدراسية والتطور المستمر في احتياجات السوق والقضايا العمرانية الملحة.
- استخدام طرق البحث العلمي لتشجيع الطلاب للاطلاع على الجديد في مجال الهندسة المعمارية والتنمية العمرانية وتقنيات التصميم وتكنولوجيا الاتصالات والمعلومات.
- وضع الطلاب في بيئة مشابهة لبيئة العمل أثناء الدراسة من أجل اكتساب المهارات العملية.

مادة (٨): مخرجات البرنامج المستهدفة Program Competencies

لقد تم تصميم برنامج الهندسة المعمارية والتصميم العمراني المقترح في جامعة النيل لكي يتميز خريج القسم بخصائص تمكنه من تحقيق طفرة إبداعية في مجال العمارة والتصميم العمراني بالإضافة إلى تكامله مع أقرانه في مجال العمل المهني والأكاديمي.

C. Competencies for ARUD Graduates

In addition to the above Competencies for All BASIC ARCHITECTURE Engineering Programs the ARUD program graduates must be able to:

- C1. Address urban issues, and human aspects into design projects, taking into consideration cultural diversity, social differences and the impact of a built form on people's daily life and community identity.
- C2. Demonstrate knowledge and understanding of public spaces; their dynamics, significance, and multi-dimensional impact drawing upon understanding the interaction between people and their built and natural environment.
- C3. Achieve desirable experience of place through integrating different scales of intervention (architecture, urban design, landscape, city planning, regional planning), and understanding the complexity of cities.
- C4. Assimilate different forms of knowledge from other disciplines into the knowledge base of architecture and urban design formulating them into integrative design criteria to inform and evaluate design solutions.
- C5. Conduct and utilize scientific research, apply explanatory and normative theory, in a highly conscious and deliberate design process of architecture and urban design.
- C6. Reflect and discern lessons learnt from practical experience in real professional environments; through internships, knowledge exchange workshops, and project-based, blended learning pedagogies.
- C7. Demonstrate knowledge and understanding of a range of ICT-based and digital design tools to enhance the documentation, analysis, production and presentation of architectural and urban design projects.

مادة (٩): مطابقة مخرجات البرنامج المستهدفة مع المعايير الأكاديمية طبقاً لمتطلبات

(NARS)

الجدول التالي يستعرض مدى تحقيق مخرجات البرنامج المستهدفة (Competencies) للمعايير الأكاديمية له طبقاً لمتطلبات (NARS 2018):

COURSE MAPPING (NARS 2018)

		A-level competencies (Engineering)										B-level competencies (Architecture)					C-level competencies (Integrated People-centred Architecture and Urban Design)

Student Workload (SWL) / semester		
Topic Category	NONE	
Topic Level	University Requirement	
Description		
This is a preparatory foundation course designed to build students' proficiency in the reading, listening and writing skills. This course will cover the mechanics of writing with special emphasis on grammar, sentence structure and paragraph organization. It also focuses on the reading skills of skimming, scanning, reading for gist, predicting and reaching conclusions, as well as summarizing and note-taking. Students are also required to write three to five paragraph academic essays.		
Lab and Tutorials		
NONE

Topic Category	Humanities and Social Sciences	
Topic Level	University Requirement	
Description		
This course introduces students to the process of writing through reading. It uses an integrated approach to teaching the skills of thinking, reading and writing that first-year students need in order to succeed in their academic work. Students are challenged to be independent thinkers by showing them how to organize information, interpret different perspectives, solve challenging problems, analyze complex issues and communicate their ideas clearly by drawing heavily on exciting topics to stimulate their interests and guide them into thinking and writing critically.

Student Workload (SWL) / semester	50	
Topic Category	Humanities and Social Sciences	
Topic Level	University Requirement	
Description		
This course builds on the skills introduced in English 101. It is developed to help students as they move to more formal, academic discourse, focusing on writing meaningful essays and developing their skills, through observation, analysis, critical reading and thinking. Emphasis is placed on the arts of style, organization and thoughtful content as well as sharpening the skills of logical reasoning and problem analysis through the development of reading comprehension strategies for informative and expository texts with focus on summarizing, analyzing and synthesizing textual material. Students will examine selected readings and stylistic strategies as a means of developing effective argument-based writing.

Topic Level	University Requirement	
Description This course focuses on the development and use of research, critical analysis, organization and revision within the writing process. Students are given instructions in library and online research and methods of documentation, using quotations and source citations for professional papers using inductive and deductive reasoning, developing the skills of scientific argumentation, persuasion, evaluation and criticism needed for a research paper. Most of the course work focuses on students’ work. Each student completes one minor and one major project during the term as well as a series of short response essays.

Description		
The ability to communicate effectively through the use of the written and spoken word is a requirement in today’s increasingly complex world. This course helps students learn and practice the skills of interpersonal and professional communication, improving on their skills in oratory and public presentations by introducing them to writing professional documents, including technical/ scientific reports, business letters, faxes, resumes, etc. It also helps them understand the report writing process by practicing techniques of writing a well-structured report as well as delivering a well-structured presentation in a formal setting. It focuses on inter-personal and professional communication with special consideration given to the cultural and linguistic aspects. Attention is also given to human perceptions, interpersonal dynamics, the art of listening and convincing as well as the value of verbal and visual symbols.

Topic Category	Humanities and Social Sciences		
Topic Level	University Requirement		
Description			
The course aims to develop a broad understanding of logical and critical thinking method; it also works between science and society in our daily lives, such as studying the characteristics of the method of scientific inquiry and to give an overview of the role of scientific communities. It can be regarded as an applicable method for helping students to develop a reliable persuasive method.

Description		
In different disciplines, students will be dealing with people; providing a service or designing for them. This course aims to raise awareness about human nature; the universalities and the variations across age, gender and other variables that affect people’s needs, expectations and preferences. The course covers the major theoretical concepts that explain the psychological processes in the human mind such as perception, cognition, stress and affective response. It discusses stressors and ways to mitigate them such as restorative environments, increased user control and the price of adaptation. It illustrates the significance of the subjective assessment of people to issues, places and innovative solutions, and how these subjective views actually shape people’s decision-making, emotions and actions. This course enables students to be more attentive to their clients and co-workers, increasing effectiveness and efficiency of their work.

Description		
The aim of this course is to give the basic knowledge and competences on how to conduct research in various scientific fields. In particular, both qualitative and quantitative data collection and data analysis methods will be addressed, in order to provide an array of scientific underpinnings for the preparation of proper research designs. Measurements as well as self-reports from questionnaires and interviews will be covered. Observational methods such as behavior mapping will also be addressed. Experimental and quasi-experimental methods will be addressed as well as case study methods to suit the different disciplines. Issues of validity and reliability, credibility and trustworthiness will also be explained as well as the different sampling techniques that suit different research aims. The skills to be developed include a proper scientific and technical vocabulary, critical reflection and evaluation of data analysis and interpretation of research results, understanding of methodological aspects, understanding and reporting of scientific papers.

Description		
This course aims to introduce first year’s students to the context of cities and urbanization – in Egypt and globally. It introduces students to the possibilities that engineering, planning, design and other professions have to shape the processes within them. The main objectives are to sensitise the students on the most significant “frontiers”, the roles and interventions needed to face the challenges and opportunities of our cities. It familiarises the students with main concepts, terms and definitions to better comprehend the various processes and the actors that shape human environments and cities. Issues include: urban issues, trends problems and opportunities, urban debates types of cities and categories of urban fabrics, planning and design approaches, methods and strategies in the 21 Century.

Description		
Descriptive Geometry is the branch of geometry concerned with the two-dimensional representation of three-dimensional objects. In other words, it is the graphical solution to three-dimensional spatial problems. Modern mechanical drawing and architectural drawing are based on the principles of Descriptive Geometry. This course is an examination of methods to develop graphical solutions to problems involving points, lines, and planes in space.		
Lab and Tutorials This is a theoretical course that includes tutorials for discussion and lab applications on the topic.

Course Title	Building Performance Computing	
Course Code	ARUD 344	
Prerequisites	ARUD 243 (Building Systems Integraion)	
Classification within the curriculum	Compulsory	
Course Position in Study Plan	Spring	
Contact Hours	Lectures	2
	Tutorials	1.5
	Labs / Studios	1
	TOTAL	4.5
EG Credit Hours	3	
ECTS	5	
Student Workload (SWL)	125	
Topic Category	Basic Engineering Sciences	
Topic Level	Engineering Requirement	
Description		
Building Performance Computing provides an introduction to computational methods and applications for building performance assessment. This course introduces thermal and visual modelling fundamentals of building performance simulation. Topics include: modeling and design, overview of thermal and visual simulation methods, introduction to the application of computational building simulation tools for thermal and visual performance assessment, case studies and assignments on the application of simulation in building design and operation. Specifically, an appropriate 3D modelling environment along with its visual scripting plugin are used as a basis for development of energy and daylighting models. To this end, the course deploys plugins toward climate analysis and generation of models for detailed building performance simulation exercises.		
Lab and Tutorials		
Labs/ Tutorials: Parametric modelling, climate and site analysis, parametric energy simulation, parametric daylighting simulation		
Practicum

1. Hensen, Jan L. M.; Lamberts, Roberto, 2011. Building Performance Simulation for Design and Operation 2. Konis, Kyle; Selkowitz, Stephen, 2017. Effective Daylighting with High-Performance Facades		

Course Title	Structure I	
Course Code	ARUD 152	
Prerequisites	ARUD 151 (Construction I)	
Classification within the curriculum	Compulsory	
Course Position in Study Plan	Spring	
Contact Hours	Lectures	2
	Tutorials	2.5
	Labs / Studios	0
	TOTAL	4.5
EG Credit Hours	3	
ECTS	5	
Student Workload (SWL)	125	
Topic Category	Mathematics and Basic Sciences, Basic Engineering Science	
Topic Level	Engineering Requirement	
Description		
<p>The aim of this course is to approach the basic structural types along history analyzing the relation between its mechanical behavior and the space generation.</p> <p>The course also covers basic structural concepts as: resistance, deformation, stress-strain curve, stress types. The student will get to know which the forces acting over the building-loads and tributary areas- and how its transmission through the structure to the ground is produced. Structural types: isostatic and hyper static and its understanding using diagrams.</p>		
Lab and Tutorials		
<p>Exercise 1- Heritage buildings visits and its structure analysis (in groups).</p> <p>Exercise 2- Short calculation exercises and its relation with real situations (in groups).</p>		
Practicum		
<p>Reflected in DESIGN STUDIO: Working with simple structures and being aware of the space they generate and their mechanical behavior.</p>		
Literature		

Course Title	Structure II – Wet construction: structural systems and pre-dimensioning (mainly rigid knots)	
Course Code	ARUD 254	
Prerequisites	ARUD 253 (Construction II)	
Classification within the curriculum	Compulsory	
Course Position in Study Plan	Spring	
Contact Hours	Lectures	1
	Tutorials	3.5
	Labs / Studios	0
	TOTAL	4.5
EG Credit Hours	3	
ECTS	5	
Student Workload (SWL)	125	
Topic Category	Basic Engineering Science	
Topic Level	Engineering Requirement	
Description The aim of this course is to explore the design, mechanical behavior and calculation (pre dimensioning) of the structural systems based on adding (masonry) or casting (reinforced concrete) mainly rigid knots. The student will deal with: wall structures -brick and block-; frame structures -cast in place concrete-; confined masonry; different slab types; foundations and retaining walls. Introduction to soil mechanics. The course includes: interventions over existing structural systems. Consolidation, refurbishment and retrofitting.		
Lab and Tutorials <u>Exercise 1</u> - Field visits description and analysis (in groups). <u>Exercise 2</u> - Short calculation exercises and its relation with real situations (in groups).		
Practicum Reflected in DESIGN STUDIO: No specific concern.		
Literature		

Course Title	Structure III – Dry construction: structural systems and pre-dimensioning (mainly articulated knots)	
Course Code	ARUD 356	
Prerequisites	ARUD 355 (Construction III)	
Classification within the curriculum	Compulsory	
Course Position in Study Plan	Spring	
Contact Hours	Lectures	1
	Tutorials	3.5
	Labs / Studios	0
	TOTAL	4.5
EG Credit Hours	3	
ECTS	5	
Student Workload (SWL)	125	
Topic Category	Basic Engineering Science	
Topic Level	Engineering Requirement	
Description The aim of this course is to explore the design, mechanical behavior and calculation (pre dimensioning) of the structural systems based on assembling either steel or wood. Mainly articulated knots. The student will deal with: steel frame structures; steel decks and steel spatial structures. Students will get to know the different connection mechanisms: bolted and welded. The course is focalized in steel and so this material will have a deep approach; nevertheless wood structures -platform frame and CLT- are also covered. The course analyses the different ferrous alloys and their life-cycle assessment. The student will deal with parametric design/pre-dimensioning using BIM.		
Lab and Tutorials <u>Exercise 1</u> - Field visits description and analysis (in groups). <u>Exercise 2</u> - Short calculation exercises and its relation with real situations (in groups). <u>Exercise 3</u> - Steel structure design and pre-dimensioning using parametric software.		
Practicum Reflected in DESIGN STUDIO: No specific concern.		
Literature		

Course Title	Const. doc BOQ Tender Doc. Site Supervision /Project Management	
Course Code	ARUD 457	
Prerequisites	ARUD 344, ARUD 356, ARUD 363	
Classification within the curriculum	Compulsory	
Course Position in Study Plan	Fall	
Contact Hours	Lectures	1
	Tutorials	3.5
	Labs / Studios	1
	TOTAL	5.5
EG Credit Hours	3	
ECTS	6	
Student Workload (SWL)	180	
Topic Category	Business administration	
Topic Level	Program Requirement	
Description:		
The course is subdivided into two categories; Const. doc BOQ Tender Doc. specifically concerned with producing the project unpriced Bill of Quantity for the Architecture and ID works only in all project phases (schematic through tender submission). Perform a Cost Estimate Process for the works of Electrical (Power, Conveying, and Communication & Security System), HVAC, Mechanical, Architectural, Structural, Landscape and Infrastructure. Perform a final review of the BOQs and Cost Estimate Lists before submission. Provide guidelines for the proper Bid Evaluation of projects. Contractor pre-qualification that is a process by which a bidder on a construction project is evaluated in order to determine whether the bidder has the skill, judgment, integrity, sufficient financial resources and the ability required to complete the required performance of a contract relating to construction work. Site Supervision / Project Management targets creating a consistent management style among all types of projects. Familiarization with project management professional (PMP) state-of-the-art. Understanding different responsibilities, roles & functions within a project.		
Lab and Tutorials		
Students will expose to and practice the techniques & process of developing Tender documents & BOQ's. Students will practice a project's cost estimation process and techniques. Students will visit construction sites to learn & gain the necessary skills in project management cycle and process and expose to different roles & functions within a project. Students will reflect upon these visits and present a seminar on what have been learnt & demonstrate the link between theory & real practice.		
Practicum		
Const. Doc/BOQ –Tender Doc course includes Procurement Strategies, Tender Action Process, Responding to Tenderers Queries and Conditions, Contractors Prequalification and registration on Technical Database, Cost Estimate & BOQ.		
Site Supervision & Project Management course includes Time & Scope Management, Cost & Procurement Management, Quality Management, HR & Communication Management, Safety & Risk Management.		
Literature

Course Title	Building Information Modeling	
Course Code	ARUD 363	
Prerequisites	ARUD 355 (Construction III), ARUD 243 (Building Systems)	
Classification within the curriculum	Compulsory	
Course Position in Study Plan	Spring	
Contact Hours	Lectures	1
	Tutorials	2.5
	Labs / Studios	1
	TOTAL	4.5
EG Credit Hours	3	
ECTS	5	
Student Workload (SWL)	125	
Topic Category	Basic Engineering Sciences	
Topic Level	Program Requirement	
Description		
The course is concerned specifically with the utilization of Building Information Modelling (BIM) technology. The aim of the course is to give students a practical, hands-on introduction to BIM and related computer-based techniques for the documentation and modelling of designed structures. The course will be focusing on the processes involved in developing a full 3D design object model, not for the purpose of visualization alone, but more importantly as a tool for understanding and documenting how a proposed building design fits together and how it will perform during use. We will be exploring the principles of component modelling, and the process of assembling those components to produce a design model from which traditional documentation (such as plans, elevations and sections) can be derived. From there, we will explore technologies that allow a BIM model to be exported and subsequently imported in to a range of design analysis packages. Several lectures will be delivered by guests from industry, affording an opportunity to understand the technology from that perspective.		
Lab and Tutorials		
During the lab Sessions student will work on BIM Software As Revit platform then will present their project through Tutorials.		
Practicum		
<ul style="list-style-type: none">Projects: 3-5 in-term projects provide a task-oriented opportunity for students to practice their skills. These projects are either individual or small group projects and they comprise a wide range of topics covered in this course.Assignments: 3-4 smaller assignments allow for practice of more defined skillsTerm Project: A term project requires students to work on one BIM topic in a self-guided manner. This project should center on the student’s interests and may require self-study of material.		
Literature		
<ol style="list-style-type: none">Course Textbook: Reference #1.Additional Resources: BIM Handbook, Autodesk Revit handout, Bentley handout, AIA and UK Codes for BIM.

Description		
Main topic: Site and Basic Program		
Arch - Following the design thinking process from inquiry to formulating a basic architecture program for a building or structure design, this studio aims at exploring the synergy of form and function, the integration of diverse structural and construction systems to be implemented in specific sites, the understanding of the logic of topography, geometry, and enclosure, and the consideration of the surrounding context including the ambient, natural, built and social environment.		
UD – Complementary fitting of the architectural discourse in the framework of urban patterns and tissues as a combination of the processes of urbanization, raising student awareness of different plot subdivisions, densities and building typologies (for example in downtown areas, gated communities, informal settlements, etc.) to build an urban vocabulary and enable them to distinguish and understand the differences in the experiential qualities of urban space. Urban analysis that takes advantage of Cairo as the main focus of exploration.

Description		
Main topic: Public Realm Settings and Street Design Arch - Within the urban framework, the space for an open collective program (markets, meeting points, transportation nodes...) is designed through the definition of a coherent technical and structural logic that translates systems of activity settings into integrated functional opportunities applying rules of geometry and proportion, structural and constructive systems, materials and light. UD - The street as a first level of urbanity and the essential scene in the public realm. Analysis of activity settings as the unit of place and basic urban interventions as supportive environment for user interaction Variables, elements and the sequence of relations that configure streetscapes and their experience.

Description		
Main topic: Home and Neighbourhood Design Arch - Drawing upon people-centred courses on dwelling and the meaning of home - considering social, psychological and cultural aspects in design and variation in user needs by age, sex and ability. This studio focuses on housing typologies, aggregation mechanisms and models of clustering. It explores layout guidelines: combinations, measurements, depths, distances, etc. that affords the appropriate, adaptable, affordable home and residential environment for diverse household structure and lifestyles UD - Residential project as a synthesis of inter-scale relationships between neighbourhood, block and dwelling. Street typology, open spaces and character in residential districts with integrated mixed-use services and leisure. It addresses designing in-between and near-home spaces, achieving different degrees of publicness (semi-private, collective, public) to satisfy community needs and territorial claims.		
Lab and Tutorials 1 or 2 projects per semester		
Practicum Field visits

Description		
Main topic: Medium Size Public Facilities and Collective Space		
Arch - Drawing from people-centred courses on special building types and considering social, psychological and cultural user-need variables of different user groups to design medium sized facilities such as schools, health centres and libraries are designed enhancing relation between function in its broadened definition, gradients of privacy and transition spaces for the collective, material, technique, structural skeleton and skin as a regulator of indoor-outdoor continuity and transition.		
UD - Fostering interaction between facilities and collective public spaces as a constitutive system of the public realm. The studio covers the scope of the collective space, its typologies, sizes and boundaries: from large urban parks or waterfronts to small plazas, midans and courtyards. Public space design of fixed and semi-fixed feature elements and their composition with an awareness of the experiential implications of the design (cognitive and behavioural) and change over time (adaptability and flexibility, management and upkeep).

Description		
Main topic: City Extension and Mix-use Programs		
Arch - Design a multifunctional fragment that combines housing, hotels, tertiary, facilities, leisure and public space. Design new buildings that integrate complex structural and enclosure building solutions, considering materials, performance of the building, etc.. showing awareness of building systems and consideration to diverse user groups moving and using the spaces for different purposes.		
UD - Designing new city extensions integrating environmental values (geography, relief, water, vegetation, etc.) with socio-economic values of mobility and accessibility in efficient ex-novo mixed-use layouts. New projects will consider connections to the existing urban fabric and the interdependence between land uses in both showing an awareness to the social and economic implications on land value, street occupancy, safety, variables of density and traffic intensity, ecological connectivity and energy efficiency.

Description		
<p>Main topic: Urban Regeneration and Adaptive Building Re-use</p> <p>UD - Urban Regeneration of mid-scale sites, through selective urban renewal and infill interventions mixed with upgrading and rehabilitation in central or peripheral areas (downtown, waterfront, etc) defying the typical “clean slate” approach. Urban proposals that balance contemporary needs and future aspirations for social, cultural and economic evolution on the one hand with heritage conservation of architectonic, cultural lifestyles, historic and social values on the other.</p> <p>Arch - Project of building adaptive re-use through new programs that retrofit their spatial, functional and material configuration; incorporating existing valuable elements into a hybrid project that introduces, revives and conserves living heritage with future needs and wants. The studio will guide in implementation of rehabilitation techniques and efficient retrofitting of structural and construction systems, natural and artificial performance of buildings (thermal, acoustic and lighting), use of traditional and modern materials.</p>

Description Graduation Project I and II constitute a 2-term studio that synthesize knowledge of the Architecture and Urban Design Program through a multidisciplinary, integrative and professional approach. The course aims to develop the students' personal skills to enable them to provide critical responses and demonstrate independence and ability to tackle a wide range of architectural and urban design standard regular projects. Working in continuity with Graduation Project II, the main goal of this course is to embark upon the development of a complex project, dealing with inter-scale design challenges integrating urban, social, psychological, cultural, technological, ecological, creative and economic input. In the first term, each student will define the scope and rationale, the program and the specific site within a broad area and will follow general guidelines to formulate the design objectives. At the level of a preliminary design, fundamentals of the project will be set (scales from 1/10.000 to 1/100): place, brief, strategies and concept and general solution guidelines, all of which will take into consideration the cognitive and behavioural implications of the design in addition to environmental, economic and social sustainability.

Description		
<p>The aim of this course is to improve the students' capabilities in organizing and performing the design process to suit the nature of each design problem as well as attain student-generated formulation of design objectives and program. It would train the students in analytical tools and systematic design thinking and methods. The course covers different models of the design process as well as design methods, tools, and techniques, such as problem-solving techniques, operational definition of objectives, architectural programming, design performance criteria. It aims to assist students externalize the design thinking process, sharpening their awareness as they think in iterative cycles between intuitive creative thinking and systematic rational thinking. The course empowers the students with analytical and representation skills to better proceed from research and knowledge acquisition to design through the explicit mapping of the problem and requirements coupled by the deliberate formulation of design objectives. Through practical implementation, students learn to develop design criteria that serve to guide their design thinking as well evaluate their design product.</p>

Description		
Designing for people is based upon an understanding of the relationship between a person and his, or her, environment; the ambient, the built, the natural and the social environment that surrounds a person. The aim of this course is to introduce to the students the nature of this interaction, the theories that explain it, and its relevance to the design of the built environment, with application in architectural and urban design. The course draws upon social psychology, anthropology and environmental psychology to provide students with the major theoretical concepts and models that mediate the relationship between a person and the physical environment that surrounds him or her. The course introduces innovative concepts to describe the built environment such as Activity Settings and Potential Functional Opportunities. It sets the framework for students to conceptualize the built form in all design studios; it is the lens through which the student will see the relation between designed space and what it may become as a 'place' when it is used. Students would apply these theories later in other courses to a variety of functional settings at architectural and urban scales.

Description		
The aim of this course is to enable students to design residential environments that are supportive to people’s lifestyles, fulfilling to their social and psychological needs in addition to the main function of shelter from the ambient environment. The people-centred approach to dwelling design is based on the explanatory theory of the meaning of ‘home.’ It sensitizes students to the concept of home as regulator of social interaction and communicator of social status and identity. Students understand how dwelling can be understood as system of activity settings with boundaries outside the private domain in shared spaces, accommodating daily activities, trips to work, opportunities for education and leisure. The course covers neighbourhood design and planning with its spatial layout, land use and connectivity, enabling students to understand and design the balance between several dichotomies such as sense of community and social mix; between economic prosperity and community privacy, between appropriation of collective space, safety, sense of belonging and accessibility, inclusiveness and equity. It explores the revival of home-based work, different contemporary lifestyles, patterns of living heritage and varying households. The course compliments the view of housing as a product, with that of housing as a process, the tenets of ‘adequate housing’ and the special considerations for different user groups; women, children, elderly...etc..		
Lab and Tutorials		
Group exercises include analysis of case studies from different countries, reflective seminar classes, Practice design thinking on improving the dwelling experience for different household structures, user lifestyles, and types of neighbourhoods. Student work presentations.		
Practicum		
Field visits, conducting empirical research, participating in workshops

Description		
The aim of this course is to enable students to design buildings and spaces with special functions such as hotels, hospitals, schools, factories and to learn about the special considerations and design criteria and principles that apply to these special facilities. The course builds upon the students' knowledge and awareness of special user groups such as children, the handicap and the elderly. It also draws upon their previous knowledge and fundamentals of environmental psychology and people-environment relations. This theory course supplements what students would search and find by themselves about design standards and building codes for specialized facilities. They enrich the students' knowledge base with innovative concepts for restorative, de-stressing, well-being promoting designs and future places.

Description		
The aim of this course is to enable students to design public spaces based on an understanding of how people perceive, understand and utilize urban space, that would in turn lead to future places that are supportive to what people want to do, minimizing the chance of misuse or neglect of these spaces. The course covers the seminal normative theories of urban design and illustrates to the students the relation between those theories, their limitations and how they relate to other courses such history of urban form, neighbourhood design and the basic theories of environment-behaviour studies. The course conveys to the students the importance of public space and the multiple functions it plays in people’s lives; how its is at once a place for movement, for leisure, a workplace and a place to learn and grow. It equips students to address public space and be able to address its multiple economic, social and political dimensions; having the knowledge and synthesizing skills to plan and design the most integral and central urban element as defined by the latest global manifestos. Through field visits and literature review, the students will be trained on physical survey, behavioral observation, reading maps, photographic documentation, conducting interviews, documentation and analysis of collected data as well as participatory design and presentation to stakeholders.

Description		
<p>This course aims at providing the students with a comprehensive understanding of urban environments’ spatial and physical dynamics. It includes two foci. One focuses on transformation and change over time in the existing urban fabric, its use, and its meaning to different users. It provides the students with the different theoretical basis that explain those spatial dynamics such as theories of building adaptability, of production and reproduction of public space, rules of appropriation, stakeholder analysis, and systems of activity settings that work together across the conventional domains of intervention and management of the built environment. This enhances the capacity of students to better predict people’s behaviour and use of spaces, patterns of mobility and propensity to participate in the upkeep and maintenance of the public realm. This enables the student to design more appropriate, adaptable environments with higher use value to diverse users, where communities can partner the public sector and reduce the burden on the government and where the built form can stand the challenge of time and transform to changing needs. The other introduces the fundamentals of urban physics that addresses ambient environmental issues related to urban-level performance of the built form as well as the interrelations among various urban systems including the urban microclimate, energy infrastructure and mobility systems. Both foci integrate in their impact on the design and regeneration of parts of cities including infrastructure, mobility, detailed land use, building morphology, and public space. Applications would include adaptive re-use and conservation of heritage building ensembles, revitalisation of heritage urban patterns such street markets, hammams, or artisan districts, as well as the urban regeneration of informal areas, historic cores, downtown areas, waterfronts...etc..</p>		
Lab and Tutorials		
<p>Exercises include group work on case studies, interacting with visiting practitioners working in local communities.</p>		
Practicum		
<p>Field visits to upgrading and regeneration projects Visits to experts in adaptive re-use and urban regeneration Participating in workshops within real on-going projects.</p>

Description		
<p>Is the city a form, or a process, or both? Are architects and urban designers responsible for the form and urban planners for the process part? How can these two, together with other parties cooperate to promote sustainable urban development and to resolve conflicting interests? Which skills, instruments and tools are needed?</p> <p>The aim of this course is to familiarize participants with the dimension of the urban planning process so that architects and urban designers understand their role and responsibilities in relation to other stakeholders. Based on a reflection of the legacy of architectural and planning professions and their paradigms the course will explore the potentials of architects and urban designers as part of a new urban planning approach that is integrated, inclusive and participatory and that follows principles such as compactness, social inclusion, integration and connected cities and neighbourhoods that are resilient to climate change. The class builds on the knowledge established in the introductory contemporary cities course (SSCI 101). It integrates research and practice and will explore lessons from relevant case studies from Egypt and beyond. Selected issues comprise: economic development, infrastructure and services, housing, environment, food security, historic preservation, regional development.</p>

Description		
<p>The aim of this course is to have students understand architectural terminology, themes and building types used in world architecture up until the 17th Century and acquire knowledge of significant structures and buildings in their historical, regional and cultural contexts in this period. Through history it explores the definitions of architecture and style as well as the relation between the built environment and the socio-cultural dimensions that shaped it through a chronological overview of the different eras in history. The study begins with the first traces of prehistoric buildings and settlements in the Ancient World and the engineering and science of the monuments of the Ancient Egyptian Civilization. It provides a survey of the Classical Civilizations focusing on the theories of aesthetics and order in architecture, art and the political dimension behind the shaping of cities in the Greek and Roman periods.</p>

Description		
The course covers a synopsis of architecture, art and city design in the Early Christian (including Coptic Cairo), and Byzantine. It will also cover the Medieval Romanesque and Gothic eras exploring the different meanings and aims of architecture. This course introduces students extensively to the history of Islamic Architecture and the formation of Islamic cities. Students begin by examining the formation, development, transfers, parallels and differences between European and Islamic architecture that are revealed in building traditions, materials, spatial layouts and related to lifestyle. They are simultaneously introduced to the ideologies, cultural, climatic and technological influences that shaped these cities, including the functional aspects reflected in the various religious, civic and residential buildings of the period and the manipulation of mass, light and acoustics from the inside-out to achieve the desired functions. This course finally covers the Renaissance, Baroque and Rococo eras in Europe. It also covers the developments of the nineteenth century and the transferal of influences that characterized it stopping at the beginnings of the industrial revolution with its innovations in materials (iron and glass) tracing its connections through eclecticism and classical revival.

Description		
The aim of this course is to understand the reflections of the 20 th C. social, economic and political movements within the scope of modern Architecture. It aims also to explore the developments that followed the 19 th C. and industrial revolution into the 20 th C. theories of Modern Architecture and its rising to set global trends in the design of buildings and cities. The course provides a detailed insight into the classification of different architectural movements and their pioneers, as well as the essential characteristics of “Modernism” and its different phases. A detailed introduction to the history of modern architecture from its intellectual and artistic origins in the nineteenth century the course proceeds to cover the emergence of technological, theoretical and aesthetic principles of modern design beginning with the socio-cultural impact of industrialization through innovations in materials (iron and glass) and new functions. Based on an understanding of the seminal views that shaped the Modernist era, those world trends were subjected to regional interpretations including the Egyptian experience led by national pioneer architects.		
Lab and Tutorials		
analyzing International and national examples.		
Practicum		
Field visits to some selected Egyptian sites.

ECTS	5	
Student Workload (SWL)	125	
Topic Category	Basic Engineering Sciences	
Topic Level	Program Requirement	
Description		
This course provides an overview of the principal theories that have informed, animated, or destabilized recent architectural discourse (Regionalism and space specificity, Tectonic expression, Environmentalism ethics and biomimicry, etc), focusing on key figures, movements, and texts from the late 1960s to the present. Recent technical approaches useful for contemporary architecture. Exploring the space as the extension of the human body; the sequence of space views experienced by people not the one from a high angle view. ICT contribution; video games which is specialized at the spatial storytelling, by collecting the scene played by people, and extend the human body. Students should be able to critically assess the ways which architectural movements achieve architectonic form; understand socio-cultural and technological factors undermining the emergence of various architectural discourses of contemporary architecture.

Student Workload (SWL)	125	
Topic Category	Basic Engineering Science	
Topic Level	Program Requirement	
Description		
<p>The aim of this course is to explore the basic requirements that arise from the function of providing shelter (comfort); and those that arise from combining diverse elements and/or materials in a single system. The student will get to know the different strategies to satisfy those requirements: from the conceptual principle to the constructive solution.</p> <p>Course content covers: vocabulary; building elements; comfort requirements; constructive requirements; construction techniques and materials. The student makes a first approach to the importance of construction in formalizing architecture studying wall-bearing heritage construction methods along local history.</p>		
Lab and Tutorials		
<p><u>Exercise 1-</u> Case of study: an example of architecture familiar to the student –house, school ...: describe it from both material and sensorial aspects. Name the elements that form it and analyze its function. Assess how the building (o a part of it) responds to the most basic functional and comfort needs. Objective: obtaining vocabulary, knowing the elements and understanding their function.</p> <p><u>Exercise 2-</u> Short exercises dealing with movements. Analyzing real situations of coercive and permissive union mechanisms (in groups). Objective: Allowing the student to discern between coercive and permissive solutions.</p>		
Practicum		
<p>Reflected in DESIGN STUDIO: Approaching the exercise in the design studio clearly understanding the importance of deeply knowing the site: its climate, topography, natural resources,... This information gives clues for design: the user and the context.</p>		
Literature		

Course Title	Construction II – Building the structure: materials and techniques	
Course Code	ARUD 253	
Prerequisites	ARUD 152 (Structure I)	
Classification within the curriculum	Compulsory	
Course Position in Study Plan	Fall	
Contact Hours	Lectures	1
	Tutorials	3.5
	Labs / Studios	0
	TOTAL	4.5
EG Credit Hours	3	
ECTS	5	
Student Workload (SWL)	125	
Topic Category	Mathematics and Basic Sciences, Basic Engineering Science	
Topic Level	Program Requirement	
Description		
<p>The aim of this course is to explore the basic construction techniques for erecting structures and the related materials to each technique. The techniques are: masonry, rammed, casting, assembling. The related material: ceramics -brick–, earth, concrete, and wood (including their life-cycle assessment). This approach to the techniques and materials studied through its application to basic structures will permit the student getting to know the constructive bases for erecting: wall structures, pillars, beams and slabs.</p> <p>In this course the student will also explore the ground and how the building is accommodated over it: Types, technical design and construction process of foundations and retaining walls (including drainage and water tightness).</p>		
Lab and Tutorials		
<p><u>Exercise 1</u>- Field visits (building on process): identifying different materials according to their form - amorphous, small elements, semi-finished products and components- and describe the related construction techniques (in groups).</p> <p><u>Exercise 2</u>- Working with models, analyze the structural types behavior (in groups).</p>		
Practicum		
<p>Reflected in DESIGN STUDIO: the skeleton as the building shape definition. Loads being bear and stability as design clues. The material used implies a technique, both (material and technique) bring the structure model to reality.</p>		
Literature		

Course Title	Construction III – Closing the building – facades and roofs – and arranging the public space		
Course Code	ARUD 355		
Prerequisites	ARUD 254 (Structure II)		
Classification within the curriculum	Compulsory		
Course Position in Study Plan	Fall		
Contact Hours	Lectures	1	
	Tutorials	2.5	
	Labs / Studios	2	
	TOTAL	5.5	
EG Credit Hours	3		
ECTS	6		
Student Workload (SWL)	150		
Topic Category	Mathematics and Basic Sciences, Basic Engineering Science		
Topic Level	Program Requirement		
Description			
<p>The aim of this course is addressing the constructions systems for closing the building: non-load bearing facades and roofs. Contemporary techniques and related materials. Facades; conventional, ETICS, claddings, rain screen, panel, curtain wall, openings and their filters. Roofs; flat roofs- watertight membranes, pitched roofs-tiles, low slope roofs- metal sheets. For all of them (facades and roofs) it will be done a system description, and deeply studied its behavior according to the climate conditions, architectonic possibilities and constructive requirements.</p> <p>This course also covers construction systems for arranging the public space.</p> <p>The course analyses the following materials: watertight membranes, thermal insulation materials, non-ferrous metals, glass, stones, cladding boards (including their life-cycle assessment).</p>			
Lab and Tutorials			
<p>Exercise 1- Development of the technical details (working drawings) of a student's previous Design Studio exercise. That exercise should have addressed a rehabilitation or intervention in an existing building so as to cover many different constructive situations (Retrofitting of heritage and industrial buildings).</p>			
Practicum			
<p>Reflected in DESIGN STUDIO: Focusing on the enclosure design and its energetic efficiency, and on the construction of the public space.</p>

Description		
The aim of this course is to explore an introduction to architectural representation, Orthographic projections, descriptive geometry, contours, paraline drawings, shade and shadows and model making are presented and applied, where some practical constructions just to get a sense of what one can accomplish using different untraditional tools by studying different details of orthographic projections and culminating in some useful applications such as casting 3d isometrics, shades and shadows and the intersection of surfaces, and the development of surfaces. The course is concerned with the graphical solution to three dimensional spatial problems and an examination of methods to develop graphical solutions to problems involving points, lines, and planes in space in addition to its perception discussing concepts such as (enclosure, complexity, uniformity, etc.) depending on VR lab and tools. Different concepts, methods, and issues of Design as a vehicle of visual organization, structure, thought, and expression. The broad scope of the subject is explored through lectures, discussions, critiques, and the process of making images, and objects. Students are introduced to the dynamics of composition, form and content, color systems and theory, aesthetic issues, visual analysis, perception, spatial structure and the value of visual awareness and creativity in an increasingly image-oriented culture. The course also seeks to provide some experience with a variety of media, develop skills in observation and technique, and encourage personal involvement in resolving a visual problem or expressing an idea. Exercises focus on specific concepts, preparation and planning, and creative visual thinking.

Description The aim of this course is to explore drawing as a tool of communication through exercises that explore observation and perception, form and proportion, representation, analysis and diagramming using a variety of materials and Media. An introduction to both drawings techniques of technical drawings whether manual or digital. On one hand the freehand drawing technique focusing on the delineation of interior and exterior spaces, starting with drawing from observation to speculative drawings, including the study of light conditions. It provides the student with the knowledge, skills and aptitude required to use a range of fundamental architectural sketching and drawing skills based on observation of the physical world, in particular the built world. On the other hand, the digital graphic communication tools and techniques in architecture. Where students learn to use digital representation tools. They acquire representation techniques of space and form in 2D and 3D using digital modeling, visual analysis, different simulations. The course covers complex intersection of volumes. In parallel, students continue their exploration of freehand representation of form, space, urban scenery and landscape in order to maintain the shift between both worlds the manual and digital of design thinking and representation.

Description The aim of this course is to present specific methods and techniques, developed in social sciences (particularly environmental psychology), for mapping lay people preferences. In particular, the focus will be put on the coding, decoding, analysis and interpretation of “subjective” data, to be compared to “objective” data concerning the same environmental feature (e.g., urban greens, residential choice,...). The course will build upon what ICT offers in the field of mapping, exploring what is termed ‘soft’ GIS.

Description This course aims to allow students to put theory into practice and develop their artistic competency and enhance their expression capabilities. It conveys to students the fundamental principles of artistic expression including graphic design which covers image making, typography, composition, working with color and shape as well as apply practical visual solutions for self-promotion, resumes, logo design, and Web design. Students will practice perspective, and learn how to draw illusions, utilize value and imply texture, understand color schemes and the color wheel. This art basics course will allow students to develop techniques through a variety of mediums including ink, colour pencil, pastels and paint and enhance their skills to create art for visual communication applications. At the end of this course students will have learned how to explore and investigate visual representation through a range of image-making techniques; practice basic principles of working with shape, color and pattern; and understand and have applied the principles of composition and visual contrast.

Topic Level	Program Requirement	
Description		
The course aims at introducing the discipline of Landscape Design and Planning as well as to its potentials, instruments and its role among various other urban disciplines. Core issues include water landscapes, intertwined urban and regional relations, place and identity, integration, and environmental preservation. It aims that students understand cities and their large-scale processes of production and consumption that are claiming more and more space, to understand the new reality that is emerging on the ground and how can the environmental qualities and the identity of places be preserved. The course covers the roles, capacities and main instruments of landscape architecture and design, also referred to as Landscape Urbanism, that is becoming more important in the contemporary situation of an all-encompassing valorization of space though urbanization. This course tackles the spaces of nature, green and the environment as core entities of urban development, instead of mere “left over” spaces. It also comprises the appreciation of various new forms of urban fabrics, at various scales such as new intertwined systems of housing, infrastructure, “logistics”, water, greens, and different natural landscapes. The course also informs students in the localization and adaptation of global systems and solutions to local contexts under consideration of local identities.		
Lab and Tutorials		
Studying case studies of local urban landscapes from the lens of natural landscapes and natural elements (water, green, desert...).		
Practicum		
Field trips. Urban transects.		

Course Title	Informal Areas	
Course Code	ARUD 375	
Prerequisites	ARUD 122

Description		
The aim of this course is to equip the students with skills and information to be able to address the root of informality and its effects based on a rights-based and social justice strategy responding to the problems of informality. It focuses on understanding the Local Community practices and how to identify the positive and negative aspects, defining the role of the different stakeholders (Local Government, NGOs, CBOs,...) and discussing the potential to partner and regulate the Local Community practices and achieve a maximizing use value when upgrading informal areas. Finally, it touches on some policies relates to informal areas and the possibility to have a future role in decreasing the formation of new informal areas.

Description		
The aim of this course is to provide the students with a comprehensive understanding of different patterns of living heritage in order to be able to achieve a sustainable heritage conservation. It addresses the potentials and issues related to the historic areas such as the urban fabric, building morphology, land value, land distribution, system of activity settings, as well as the heritage lifestyle patterns, territorial domains, claims of public space, and the sustainability of commercial and productive heritage activities. It also emphasizes the importance of historic areas as an asset focusing on the value of this living heritage and the importance of redirecting the different perceptions towards these areas, discussing the transformations happening in the historic areas and the different ways to mitigate the negative aspects in order to save them from losing the heritage but rather turning them into potentials for economic development and social sustainability.
